当功率型热敏电阻之环境温度或它本身的温度上升时，电阻值随之减小。 When the ambient temperature of the power type themistor is applied,or its temperature rises, the resistance decreases.	当功率型热敏电阻在小电流下工作时，由于功率太低，其电阻值保持固定而表现线性(符合欧姆定律V/R=I)。如果电流增加，功率型热敏电阻就会产生焦耳效应(P=V*I)而使自己发热，其电阻随即减小表现(电流增加，电压下降)的状态。 When the power themistor works at small current when the power is too low,the resistance is kept constant and behave lineary (in acordance with Ohm's law,V/R=I).If the current increases,the power type themistor will produces a Joule effect (P=V*I) and makes itself hot.The resisance then deereases (current increases,voltage decreases) State.	功率型热敏电阻与环境达成热平衡所需的时间，主要决定于材料热容量(H)及散热系数(δ)。 The power type themistor achieves heat with the environment.The time required for the equilibrium is mainly determined by the heat of the metarial.Capacity(H) and heat transfer coefcient(delta).
